

The contribution of Nigerian Export-Import (NEXIM) Bank Towards Export (Non-Oil) Growth in Nigeria [1990-2005]

Usman, O. A and Salami, A. O
Ladoke Akintola University of Technology, Nigeria

Abstract

This study is in respect of the Nigerian economy and covers a period of fifteen years, 1990-2005, also, the activities of the Nigerian export-import bank is evaluated to highlight its contribution to export growth performance in Nigeria. Data for the study was sourced from various issues of the federal office of statistics publication, Central Bank of Nigeria, (CBN) publications, International Financial Statistics (IFS) by International Monetary Fund, Annual reports and statement of accounts of the Nigerian export-import bank (NEXIM). The study takes into cognizance the simple econometric analysis model, using the ordinary least square (OLS) method of estimation. This is because the model analysis is relevant when studying complicated economies such as Nigeria because of her structural and institutional rigidities. Available data suggest that non-oil exports performances during these periods remained less than satisfactory, as evidenced with high sensitivity of prevailing levels of exporters' transparency or lack of it. Since there are valid reasons to believe that some export transactions might have been omitted as exporters sought to gain from a relatively speculative environment with large arbitrage opportunities, a verdict of unsatisfactory non-oil export performance in particular and total export in Nigerian ever since, and in spite of introduction of various policies, should be regarded with some circumspection.

Conceptual Framework

The introduction of the Nigerian export-import bank (NEXIM), became important when it was obvious that export promotion programs instituted by such agencies as the Nigerian export promotion council; export processing zone; tax subsidy program; concessionary financing program and export credit guarantee scheme, lacked the credit to finance agricultural development and local investment.

NEXIM started its operation with a share capital of N500million in 1991, and its statutory functions were as follows:

- (i) Provide export credit guarantee and export insurance facilities to non-oil exporters.
- (ii) Provide credit in local currency to support exports.
- (iii) Maintain a foreign exchange revolving fund for lending to exporters who need to import foreign inputs to facilitate export production.
- (iv) Provide domestic trade with insurance to assist exports and;
- (v) Establish and manage funds connected with exports.

While arguments for or against the role of export in economic growth ranges on, several empirical studies corroborates the assertion that export is an engine of growth in most economies of the world. Flemming (1962) demonstrated the overall effects of external trade as depending on the differences between export and imports, also for exchange product market and money market, concluding by emphasizing the adequate mixture of trade and exchange rate policy, fiscal and monetary policy, as a prerequisite for rapid economic growth and development.

Oyejide (1975) confirmed the positive relationships that exist between export and economic growth. Fosu (1991) ascertained a highly significant and positive relationship between export and output growth rates. Ayodele (1997) opined in his study that export success contributes to economic growth. By and large, it has been largely held by a good number of development economists that trade is an engine of growth. In other words, trade (export) enhances growth of an economy.

Model Specification

The behavior of the Nigerian non-oil sector is of paramount importance in this study. So the emphasis lies on total non-oil export, demand and supply function of non-oil export of the world market. Six stochastic equations which specify the manner which an economic variable responds to changes in other variables, that includes random disturbances are estimated in this study.

The supply function is the basis of the first equation, bearing in mind that non-oil export is influenced and determined by world prices. Note that in as much as higher prices of cocoa (tonners) bring about more supply to the world market, *ceteris paribus*,

total supply of non-oil export to the world market depends on total non-oil output in an economy. Supply functional form can be expressed as:

$$NEX_t = P_{WR} + NGDP - \Delta X_R$$

Where NEX_t is non-oil export; P_{WR} is average World price; $NGDP$ is non-oil output in millions of Naira, and ΔX_R is real exchange rate. Linearizing the supply function, it becomes:

$$NEX_t = \theta_0 + \theta_1 P_{WR} + \theta_2 NGDP - \theta_3 \Delta X_R + U_t \quad (1)$$

Where, NEX_t non-oil export; P_{WR} – average world price, $NGDP$ - non-oil output (NM); X_R real exchange rate; U_t error term. Real exchange rate can be determined by:

$$\frac{P_{WR}}{CPI} = X \frac{NER}{1}$$

Where CPI is consumer price index and NER is nominal effective exchanges rate.

If equation (1) is expressed further to accommodate per capital non-oil export, the estimation becomes:

$$\frac{NEX_p}{P_{OP}} = \theta_0 + \theta_1 \frac{NGDP}{P_{OP}} + \theta_2 \frac{P_{WP}}{P_{OP}} - \theta_3 \Delta \frac{X_{RP}}{P_{OP}} + U_t \quad (2)$$

Where NEX_p is per capital non-oil export (NM), $NGDP$ is per capital non-oil output in millions of Naira, P_{WP} is per capital world price, ΔX_{RP} is per capital foreign exchange inflows, U_t is error term and P_{OP} is total population.

When equation 2 is logged elasticities are measured in terms of world prices index (PW); non-oil GDP (NGDP) and real exchange rate (ΔXR), given rise to equation 3; such that:

$$\text{Log } NEX_t - \log \theta_0 \log P_w + \theta_2 \log NGDP - \theta_3 \log \Delta X_t + U_t \quad (3)$$

Where $\log NEX_t$ is log of non-oil export; $\log P_w$ is world price index, $\log NGDP$ is log of non-oil output, $\log \Delta X_t$ is log of real exchange inflows and U_t error term.

The log of per capital non-oil exports can also be taken, such that:

$$\text{Log} \frac{NEX_p}{P_{OP}} = \theta_0 + \theta_1 \log \frac{NGDP}{P_{OP}} - \theta_2 \frac{\Delta X_{RP}}{P_{OP}} + U_t \quad (4)$$

Where $\log NEX_p$ is log of per capital non-oil export, $\log NGDP$ is log of per capital non-oil output, $\log \Delta X_R$ is log of per capital foreign exchange inflow and U_t error term.

If the logarithm of per capital non-oil export is expressed in both non-oil export and real exchange rates, and world price is determined exogenously. The analytical comparison of both equation 2 and 4 can be determined, so that *a priori* expectation sign for non-oil output is positive and negative in the case of real exchange rates.

This is in line with Titilola (1997) who stated that total production of major producing and exporting nations will have a negative effect on export. In essence, exports are affected by exchange rates, since low value of naira will result to more export, while high value reduces it. This deduction leads to the fifth equation, which is the export function, stated as;

$$X_p = \beta_0 + \beta_1 P_w + \beta_2 \Delta X_t + I_t \quad (5)$$

Where X_p is total export (NM), P_w average world Price index, ΔX_t exchange rate, I_t is the error term.

Equation six (6) is the demand functional form, which is estimated as a response function at the world market. Quantity value of non-oil export demanded in a given year

is dependent in prices in the previous year. A prior expectation signs have positive effect on the world market.

$$NEX_t = \alpha_0 + \alpha_1 P_{wt-1} + \alpha_2 X_{t-1} + \alpha_3 T_m + U_t \quad (6)$$

where NEX_t is non-oil export in a given year; P_{wt-1} is average world price index in the previous year; X_{t-1} is total export in the previous year; T_m -range of time, (which captures changes in production as a result in technological change and other factors like professionalism), U_t is the error term.

The impact of structural adjustment program (SAP) is measured by the introduction of dummy variables in all the equation, in as much as the logarithms are used to assess the speed of adjustments SAP's contribution depends on the interactions of the coefficients employed. If the coefficient interactions are positive and greater than zero, SAP is said to have a significant impact on export growth performance.

Contributions of NEXIM bank towards export (non-oil) growth in Nigeria 1990-2005

The mission statement of NEXIM is stated thus: "to become an efficient, responsive, first class commercially-oriented and export stimulating institutions committed to bringing about export-led recovery, as well as a culture of self inspired and sustained exporting in Nigeria".

Little wonder, the banks operational activities can be classified under specified facilities provided;

ADB (African Development Bank) export stimulation loans (1990-2005):

The Nigerian Export-Import Bank (NEXIM) was first referred to as the Export Guarantee and Insurance Corporation. Its first prominent task was the bearing of about US245 million dollar export stimulation loan disbursed through 41 merchant banks, and 21 commercial banks to 124 export oriented projects in areas such as cocoa, rubber trawling, food processing and garment manufacturing (table 6). Cocoa processing assumed the largest percentage share with 27.06 percent; followed by trashing with 16.98

per cent; oil seed processing 14 per cent of loans and 19 benefiting projects table 6. Food processing took 4.99 per cent of the loan with just 8 benefiting projects. As a result NEXIM bank has become the predominant source of short-term trade financing provided for the non-oil export sector, with banking system providing less than 9 cent from their resources in 1993 (Table 2).

Between 1990 and 2005, NEXIM has been a consistently rising trend for short term credit provision of about 35 per cent in 1990, 70 per cent in 1991, close to 90 per cent in 1992 and over 91 per cent in 1993. Table 2 shows the value of non-oil export growth during the period under review, N3259.6 million in 1990; N4677.2 million in 1991; N4227.8 million in 1992, and N5022.3 million in 1993.

Export credit rediscounting and refinancing facility (PRF):

This facility is designed to assist banks to provide pre-and post shipment finance in local currency in support of non-oil export. This is to enable exporters' access to the expanded export portfolio of banks at preferential rate. The trend of disbursement under this scheme was N137.2 million in 1990; N2,098.9 million in 1991; N2,871.2 million in 1992 and N3,026.7 million in 1993.

Cocoa product and rubber products had the largest share in percentage of credit between 1990 and 1994, cocoa having a share of whopping 54.3 per cent in 1990; 46.9 per cent in 1991; 25.1 per cent in 1993. It was only in 1992 that cocoa had 24.0 per cent rubber 25.0 per cent. Shrimps have 6.1 per cent share of the credit in 1990; 8.1 percent in 1991; 16.4 percent in 1992 but fell to 10.4 percent in 1993.

Foreign input facility:

This facility was created in 1991, to the export sector with immediate foreign exchange requirement needed for importation of raw materials, packaging materials and capital equipment needed for production of goods meant for export. It is made available in foreign currency and repayable in foreign exchange.

The sum of 94 million US dollars was disbursed in 1991 for which cocoa processing accounted for 29.2 million US dollar representing 29.4 percent share. Textiles

had a share of 18.6 percent, followed by trawling with 14.7 percent of the total disbursement, while chemicals had 0.3 percent (Table 6).

In 1992, total loans available for disbursement reduced drastically from 99.3 million US dollars to 26.9 million 21.3 percent went to cocoa processing, oil seed 5 million US dollars (18.6 percent), rubber processing had the least share with about 400,000 dollars (1.3 percent). In 1993, the loan facility reached its lowest, with just 2 million (700 thousand US dollars) as total disbursement; petroleum drilling took 2 million dollars (74.1 percent), leaving just 700,000 dollars to be shared among the remaining products, with 11.1 percent as well to leather.

Stocking facility:

This was created in 1991. This facility was made available by NEXIM, in local currency to enable producers of exportable goods to procure adequate local raw materials (seasonal) needed to keep their production at optimal levels particularly when such raw materials are scarce. (Tables 5a and 5b).

Manufacturers are expected to produce a ware house warrant, insurance policy on goods and a letter of hypothecation giving rights to the goods to the bank through which the facility is disbursed in order to benefit from this facility. It is available for a maximum feature of a year.

In 1991, cocoa beans had 4,883 tons quantity stocked with N63 million disbursement, rubber 3,340 tons quantity stocked with N17.2 million, while palm kernel had 25,000 tons quantity stocked with N10 million. Also, raw material stocking worth N249.1 was granted in 1992 through 17 banks for the procurement of cocoa beans, rubber, palm kernel, cotton, lint, raw skin and cashew nuts. In 1993, N281.5 million were granted for the procurement of the same baskets of goods as in 1992, cocoa topping the list of items stocked, with a share of N120.3 million or 42.7 percent of total disbursement. Overall assessment of NEXIM Within the periods under review (1990-2005), it could be noted that the effort of NEXIM is towards export promotion, this can be confirmed with the available information provided thus far.

However, available data suggest that non-oil exports performances during these periods remained less than satisfactory, as evidenced with high sensitivity of prevailing

levels of exporters' transparency or lack of it. Since there are valid reasons to believe that some export transactions might have been omitted as exporters sought to gain from a relatively speculative environment with large arbitrage opportunities, a verdict of unsatisfactory non-oil export performance in particular and total export in Nigerian ever since, and in spite of introduction of various policies, should be regarded with some circumspection.

The reasons for these uninspiring results in spite of dogged efforts at tapping the hitherto potentials could be briefly enumerated as: (1) the problem associated with export production, (2) low world price, (3) high market and product concentration, (4) existence of burdensome levies and charges, (5) poor marketing knowledge as a result of poor communication networks, (6) discouraging trade policies in buyer countries, (7) uncomplimentary macro-economic policies within the economy, (8) inadequate trade-facilitating stoical infrastructures, and (9) emerging diplomatic now and internal socio-political imbroglio that often culminated into conspiratory trade relation.

With these problems, notwithstanding, the enhancement of values added non- oil exports has gained ground with the activities of NEXIM; table 3, table 4 and table 6.

The introduction of various facilities aimed at enhancing and upgrading the value of non-oil export by NEXIM, has created avenue for improving the quality and their price as well.

Table 5 equally indicate another promising area in the Nigerian exports over the years, shipping service rising significant by 68 per cent, chemical export e.g. urea, although not termed as a non-oil export in Nigerian, gave a bright future in chemical exports.
